Project Overview

This project focuses on identifying and analyzing the user experience (UX) challenges faced by non-English users when interacting with mobile applications. In multilingual countries like India, a majority of users prefer regional languages, yet most mobile interfaces remain English-centric. This mismatch results in confusion, navigation errors, and limited accessibility for non-English-speaking users.

The project aims to understand these usability barriers and propose inclusive UX solutions that improve clarity, reduce cognitive load, and enhance overall application accessibility.

Specific Objectives

1)To study the difficulties non-English users face while using mobile apps.
2)To analyze how language dependency affects user navigation and task completion.
3)To evaluate common UX design flaws such as unclear icons, text-heavy screens, and complex layouts.
4)To propose simplified, language-neutral, and accessible UX patterns.
5)To design prototypes demonstrating improved UX for non-English-speaking audiences.

Key Features

1)Language-neutral and culturally understandable icon design
2)Simplified navigation flow suitable for low-literacy users
3)Localized text and UI support for regional languages
4)Voice-guided instructions for improved accessibility
5)Clear onboarding and tutorial screens
6)High-contrast and visually guided UI for intuitive understanding

Project Usecases & Scope

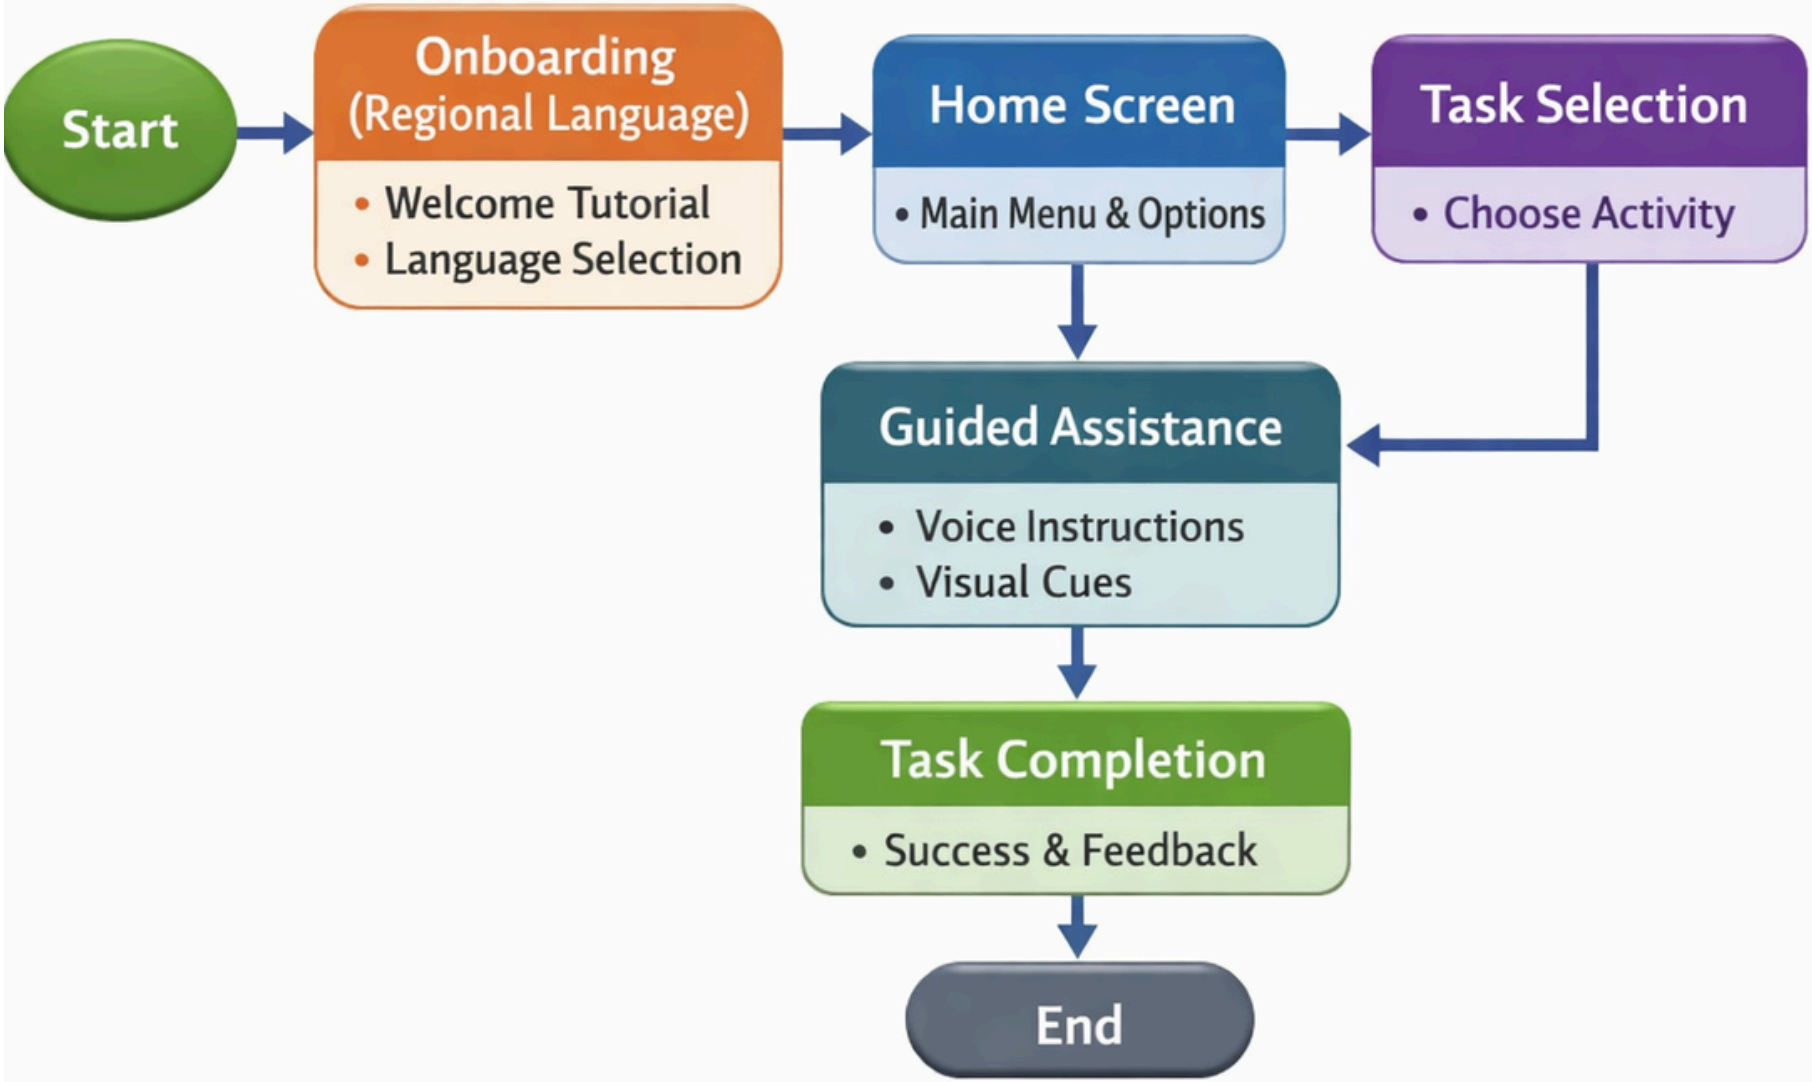
USE CASES

1)Elderly users who cannot read English
2)Rural users with low digital literacy
3)First-time smartphone users
4)Users accessing essential apps (UPI, govt apps, health apps) in regional languages

SCOPE

1)Analysis of usability issues in existing mobile apps
2)Design of improved UI/UX prototypes
3)Limited to mobile application UX and usability testing
4)Does not include backend or full application development

Prototype/Project Flow diagram/Architecture



Data & Resources

1)User surveys (Google Forms)
2)User interviews with non-English speakers
3)Existing mobile app interfaces (for analysis)
4)Figma (for design)
5)Accessibility guidelines (WCAG, Material Design)

Methodology

Research Phase

- Literature review
- Study UX & accessibility guidelines

User Research

- Surveys with non-English users
- Interviews with first-time smartphone users

Analysis Phase

- Evaluate existing mobile apps
- Identify pain points & usability issues

Design Phase

- Create wireframes in Figma
- Redesign icons & simplify layouts
- Build user-friendly navigation flow

Methodology

Testing Phase

- Usability testing with target users
- A/B comparison with existing designs

Review Phase

- Gather feedback
- Make final UI/UX improvements

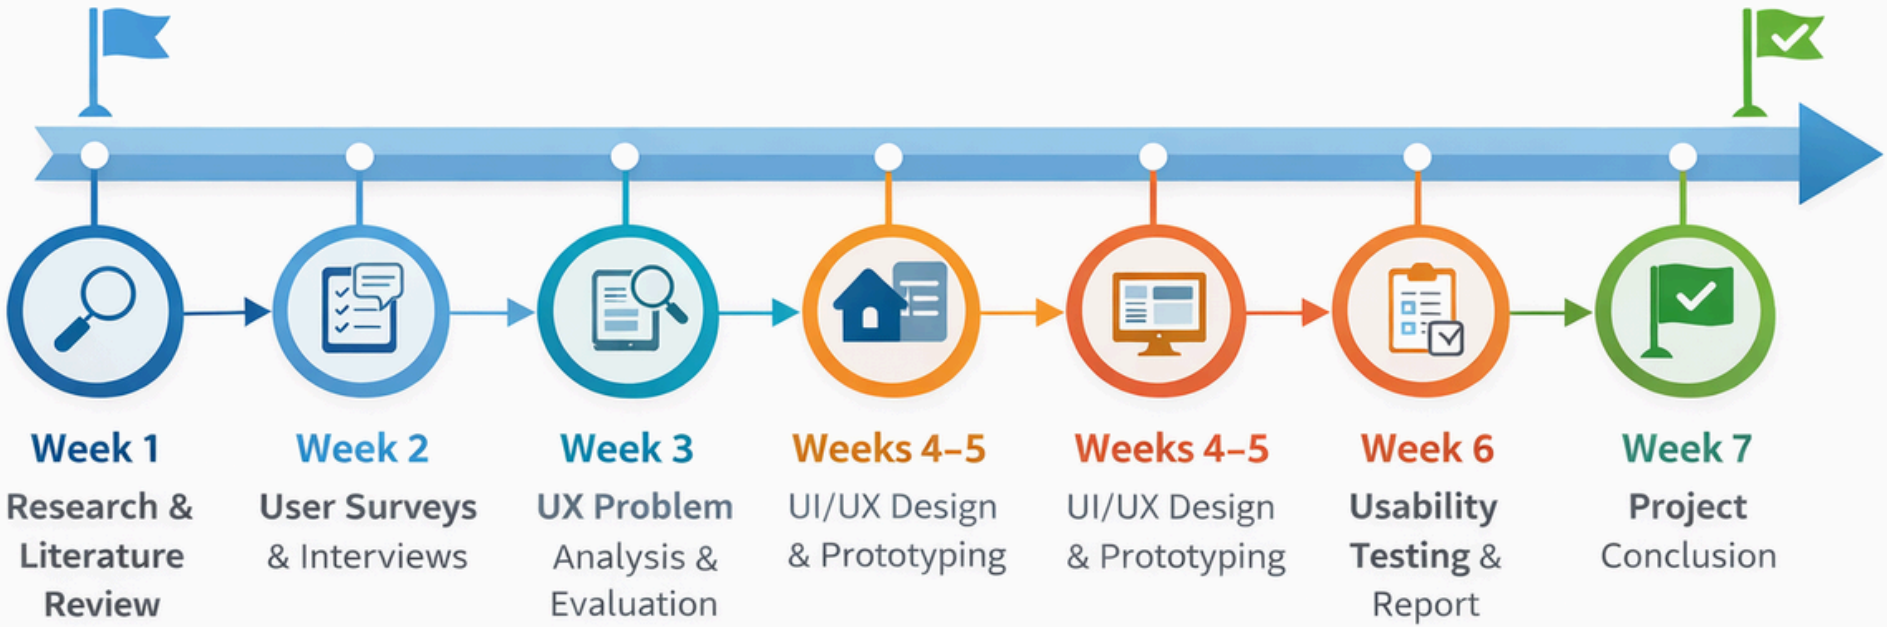
Tools & Technologies

- Figma
- Google Forms
- HTML / CSS / JavaScript (optional prototype)

Expected Results & Impact

1)Improved task completion rates for non-English users
2)Better accessibility for elderly and rural populations
3)Reduction in confusion and navigation errors
4)A reusable UX framework for inclusive mobile design
5)High-impact relevance for India’s “Digital India” vision

Project Timeline



THANK YOU
